

PPO = expert engine only · distillation creates  $z$  · sharing = primary experimental variable · crossover = validation

*Successful method pipeline (Claim A). Not a new PPO variant: opponent-specific PPO experts are distilled into discrete strategy modes under a common recipe, then progressively shared while closed-loop payoff specialization is measured. Share-0 is a bit-exact expert-dispatch control (not a distillation rung). SP-PPO/CSC/SPFT are excluded (sealed non-recovery; appendix only).*
