

Claim A quantitative ladder: Exact sealed means and percentile-bootstrap 95% CIs (n=128 matched seeds). Share-0 is the bit-exact expert-dispatch control; Encoder/Backbone/Macro share one distillation recipe (sharing axis only among those three). Share-0/Encoder preserve the joint crossover gate; Share-Backbone still PASSes with lower Delta_A; Share-Macro FAILs because $LCB_{95}(\Delta_A)=0$. Right: paired D vs Share-0 (x = detectable loss). Not an SP-PPO result.
