

(a--b) Closed-loop win rates with 95% bootstrap CIs. Specialists establish the specialization pattern; π_G is the no-strategy-code baseline; z_0/z_1 are forced codes of one shared Rung-1 policy $\pi_\theta(a|o, z)$. Hatched bars = latent codes. (c) Forced-z behavior proxies (exploratory characterization). Seed blocks differ (π_G /specialists $n=64$; latent $n=128$) -- pattern comparison, not a matched five-way test. Sharing ladder: see [fig_sharing_ladder_2v2](#).
