

Causal chain for Claim A. (a)~Independent PPO experts establish complementary payoff strategies. (b)~Matched-state distillation transfers them into discrete modes of one Share-Encoder controller ($z_0 \sim \pi_A, z_1 \sim \pi_B$). (c)~Sealed Δ_A, Δ_B with 95% CIs across progressive sharing ($n=128$); Backbone still PASSES but is already degraded; Macro FAILs ($LCB_{95}(\Delta_A)=0$). Robotics takeaway: shared perception can be tolerable; strategy-specific higher-level capacity is where specialization becomes fragile. Not an SP-PPO result (appendix ablation). Share-0 is expert dispatch (structural control); Enc $\rightarrow$ Back $\rightarrow$ Macro share one distill recipe.
