

Same shared latent policy; bars are forced  $z$  under each opponent regime. Coarse telemetry means are largely *pole-driven* (situation), with smaller within-pole  $z_0$  vs  $z_1$  gaps -- do not over-read these as tactic cartoons. For matched-state visual proof that flipping  $z$  changes spatial layout, see fig\\_qualitative\\_latent\\_2v2. Source: exploratory  $z_0/z_1$  characterization ( $n=24/\text{cell}$ ; not a gate).
